in this newly updated second edition of blood pressure monitoring in cardiovascular medicine and therapeutics william b white md and a panel of highly distinguished clinicians give a critical review of every aspect of the evaluation of high blood pressure this includes home and ambulatory blood pressure monitoring the relationship between whole day blood pressure and the cardiovascular disease process and the effects of antihypertensive therapies on these blood pressure parameters world class contributors describe the significant advances in our understanding of the circadian pathophysiology of cardiovascular disorders and demonstrate that ambulatory blood pressure values are independent predictors of cardiovascular morbidity and mortality this book provides a comprehensive up to date resource of this dynamic field in hypertension and vascular disease

this book is the first comprehensive overview of the emerging field of cuffless blood pressure monitoring increasing clinical evidence proves that longitudinal measurements of blood pressure allow for earlier detection and better management of multiple medical conditions and for superior prediction of cardiovascular events unfortunately today s clinical and industry standards for blood pressure monitoring still require the inflation of a pneumatic cuff around a limb each time a measurement is taken over the last decades clinicians scientists and device manufacturers have explored the feasibility of technologies that reduce or even completely eliminate the need of cuffs initiating the era of cuffless blood pressure monitoring among the existing literature this book is intended to be a practical guide to navigate across this emerging field the chapters of the handbook have been elaborated by experts and key opinion leaders in the domain and will guide the reader along the clinical scientific technical and regulatory aspects of cuffless blood pressure monitoring

a revolution began in my professional career and education in 1997 in that year i visited the university of minnesota to discuss collaborative opportunities in cardiac anatomy physiology and medical device testing the meeting was with a faculty member of the department of anesthesiology professor paul iaizzo i didn t know what to expect but as always i remained open minded and optimistic little did i know that my life would never be the same during the mid to late 1990s paul iaizzo and his team were performing anesthesia research on isolated guinea pig hearts we found the work appealing but it was unclear how this research might apply to our interest in tools to aid in the design of implantable devices for the cardiovascular system as discussions progressed we noted that we would be far more interested in reanimation of large mammalian hearts in particular human hearts paul was confident this could be accomplished on large hearts but thought that it would be unlikely that we would ever have access to human hearts for this application we shook hands and the collaboration

was born in 1997 in the same year paul and the research team at the university of minnesota including bill gallagher and charles soule reanimated several swine hearts unlike the previous work on guinea pig hearts which were reanimated in langendorff mode the intention of this research was to produce a fully functional working heart model for device testing and cardiac research

explains and illustrates the principles and application of commonly used technologies in perinatal and neonatal medicine
