a text for the combined sedimentology stratigraphy course or can be used for separate courses offered in the

geosciences at the junior level and up covers processes that form sedimentary rocks describes the important physical chemical biological and stratigraphic characteristics of these rocks and interprets depositional environments

the updated textbook is intended to serve as an advanced and detailed treatment of the evolution of the subject of stratigraphy from its disparate beginnings as separate studies of sedimentology lithostratigraphy chronostratigraphy etc into a modern integrated discipline in which all components are necessary there is a historical introduction which now includes information about the timeline of the evolution of the components of modern stratigraphy the elements of the various components facies analysis sequence stratigraphy mapping methods chronostratigraphic methods etc are outlined and a chapter discussing the modern synthesis is included near the end of the book which closes with a discussion of future research trends in the study of time as preserved in the stratigraphic record

volume 1a principles of geologic analysis a how to primer describes the basic concepts petroleum geologists and students need to understand hydrocarbon exploration in a broad range of geological settings globally volume 1b phanerozoic rift systems and sedimentary basins incorporates industry data to present regional seismic lines and cross sections to accurately document and analyze proven hydrocarbon systems it also includes summaries of analogue and theoretical models as an essential backdrop to the structure and stratigraphy of a variety of geological settings volume 1c phanerozoic passive margins cratonic basins and global tectonic maps focuses on both volcanic and non volcanic passive margins as well as cratonic basins critical habitats for hydrocarbons it provides a unique basis for comparison of different passive margins and for an understanding of their structural and stratigraphic evolution as well as their petroleum systems especially useful to explorationists working in deep water basins and researchers examining the tectonic evolution of the continent ocean transition a vast amount of data to enable hydrocarbon play assessments and analysis on passive margins is also included in this thorough yet accessible reference individual volumes can also be purchased 9780444530424 9780444563569 9780444563576 volume 1a discusses in detail the principles of regional geological analysis and the main geological and geophysical tools used in basin analysis volume 1b features simple documentation and analysis of major rift systems developed in contrasting geological settings as well as in depth analyses of active rifts in various regions all over the world for immediately implementable petroleum exploration applications volume 1c features real world case

there is a large and growing need for a textbook that can form the basis for integrated classes that look at minerals rocks and other earth materials despite the need no high quality book is available for such a course earth materials is a wide ranging undergraduate textbook that covers all the most important kinds of inorganic earth materials besides traditional chapters on minerals and rocks this book features chapters on sediments and stratigraphy weathering and soils water and the hydrosphere and mineral and energy deposits introductions to soil mechanics and rock mechanics are also included this book steers away from the model of traditional encyclopedic science textbooks but rather exposes students to the key and most exciting ideas and information with an emphasis on thinking about earth as a system the book is written in such a manner as to support inquiry discovery and other forms of active learning all chapters start with a short topical story or vignette and the plentiful photographs and other graphics are integrated completely with the text earth materials will be interesting and useful for a wide range of learners including geoscience students students taking mineralogy and petrology courses engineers and anyone interested in learning more about the earth as a system

aimed at advanced undergraduates but suitable also for graduate students and professionals it covers processes of sedimentation describes the characteristics of sedimentary rocks formed in major sedimentary environments and discusses the fundamental principles of stratigraphy and basin analysis including recent developments in the important fields of magnetostratigraphy seismic stratigraphy sequence stratigraphy isotope stratigraphy and sea level analysis the book presents divergent views on controversial topics and is extensively referenced and up to date thus encouraging students to refer to recently published literature

a collection of regional papers on quaternary glaciation are presented here under the major section headings of western canada arctic canada and eastern canada

permian fusulinaceans are widely distributed in carbonate rocks in shelf and basinal facies within the sverdrup basin and they provide a means by which particular sedimentological events within the basin can

be dated perhaps of broader significance for an historical perspective they provide a means whereby permian strata within the sverdrup basin can be correlated with permian rocks in continental north america and in other regions of the world in order to better evaluate the hydrocarbon resources available to canada this report presents information that will be of considerable value in interpreting the geology of an important part of the canadian arctic

this report describes the geology of an area of some 500 square miles that includes part of yelverton pass and the head of tanquary fjord in northern ellesmere island the report deals mainly with the stratigraphy of upper paleozoic and mesozoic rocks in addition major structural features are discussed

this report describes the geology of the devonian rocks of the most northwestern part of mainland canada in the northern yukon territory and adjacent district of mackenzie an area under study since 1962 by geological survey of canada scientists under operation porcupine
