this paper develops an interpretation of the asian meltdown focused on moral hazard as the common source of overinvestment excessive external borrowing and current account deficits to the extent that foreign creditors are willing to lend to domestic agents against future bail out revenue from the government unprofitable projects and cash shortfalls are re financed through external borrowing while public deficits need not be high before a crisis the eventual refusal of foreign creditors to refinance the

country's cumulative losses forces the government to step in and guarantee the outstanding stock of external liabilities to satisfy solvency the government must then undertake appropriate domestic fiscal reforms possibly involving recourse to seigniorage revenues expectations of inflationary financing thus cause a collapse of the currency and anticipate the event of a financial crisis the empirical section of the paper presents evidence in support of the thesis that weak cyclical performances low foreign exchange reserves and financial deficiencies resulting into high shares of non performing loans were at the core of the asian collapse

a country's financial system is internationally illiquid if its potential short term obligations in foreign currency exceed the amount of foreign currency it can have access to in short notice this condition may be crucial for the existence of financial crises and or exchange rate collapses Chang and Velasco 1998a b in this paper we argue that the 1997-98 crises in Asia were in fact a consequence of international illiquidity this follows from an analysis of empirical indicators of illiquidity as well as other macroeconomic statistics we trace the emergence of illiquidity to financial liberalization the shortening of the foreign debt structure and the currency denomination of assets versus liabilities we explain how financial crises became exchange rate collapses due to a government policy of both fixing exchange rates and acting as lender of last resort finally we outline the policy implications of our view for both preventing crises and dealing with them

this paper constructs a simple model of home production that demonstrates the connection between the intertemporal elasticity of substitution in market consumption ϵ and the static elasticity of substitution between home and market consumption σ when the utility function is additively separable over home and market consumption understanding this connection is important because there is a large body of empirical evidence suggesting that the ϵ is small but little evidence on the size of the σ we use our framework to shed light on the properties of a home production model with a low ϵ we find that such a model must have two fundamental properties in order to match key aspects of the u s aggregate data first the steady state growth rate of technology must be the same across sectors second shocks to technology must be sufficiently positively correlated across sectors

this paper evaluates the tax reforms carried out in sweden between 1980 and 1991 we use a recently developed nonparametric estimation technique to account for labor supply responses we decompose the tax returns to study how the separate components influence hours of work tax revenues distribution the results indicate that the reform was underfinanced and that the increased indirect taxation and redesigned transfer system almost eliminated the positive effects on hours of work due to the decreased marginal taxes on labor income further the predictions of a parametric estimated labor supply model the responses of the parametric model is almost twice the size of the nonparametric
